

Let's keep the  
lights on in  
Virginia.

**Here's the problem:** Demand for electricity has far exceeded earlier projections for 2006 and beyond. That's why Dominion has proposed building a new transmission line to make sure Northern Virginia doesn't experience a blackout like the one in Ohio and New York in 2003.

A new transmission line from West Virginia to the Loudoun substation to serve Northern Virginia will be proposed this spring to the State Corporation Commission for its approval. While the final route has not been chosen yet, we're looking

at every alternative to minimize disruption to the citizens who live in the area.

But the disruption to homes, schools and businesses in Northern Virginia will be tremendous if this line is not built.

We're working hard to bring you reliable power that will be there for you every day. That's our promise to Virginia.
